

# Core

From Engineering Dictionary

Related Keyword: [core](#), [insert](#), [mold](#)

English: Core

Molded article forming part of mold. Set parts including carving corner hole or round hole for template of main body of mold it. Because abrasion resistance is necessary so that the core may always receive friction by the flow of heat and melted plastic while molding it, only the core often uses a high-level raw material. Moreover, the processing can be facilitated because it is small at shape etc. where two or more complex shape and the same shape queue up. The core installed on the cavity core and the core side is called a core , and the core installed on the cavity side is used properly according to shape and the material of the molded article.
