English: Loose Core

The undercut in the molded article is processed. The molded article is lifted when it is coupled as ejector plate, and goes up and it runs away internally. The slide might not go smoothly if it is not allowed not to go up above than the movable side template though it is necessary to do the slide to the position in which the inclination slide comes off the molded article completely. Moreover, when two or more are used, it is necessary to prevent the loose core being hit mutually when the loose core is moved.
